

# Shaping steel.

## What is a standard mould?

Mould tools are used to manufacture moulded plastic parts. These tools are made up of several steel plates as well as accessories which are produced by Meusburger. The toolmaker in turn will machine with milling and grinding operations the desired cavity (which will be filled with fluid plastic).

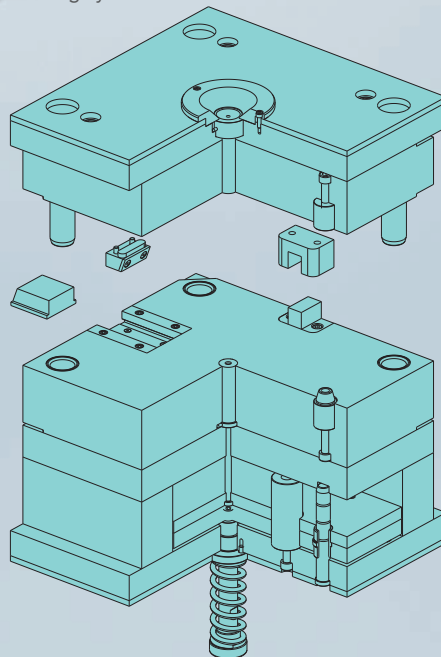

The mould tool consists of a fixed half and a moving half which are opened and closed with guiding elements such as pillars and bushes.

Both mould parts have to be adjusted within very narrow tolerances to fit together and close thoroughly.
